

Attachment no. 4E – Survey and Feedback Result Indicators

This attachment shows the key result indicators for the survey and feedback which assessed the final outcome of the project 'AI tools and students' understanding of international issues.' This attachment primarily serves to compare the projected result indicators from Semester 5 preparation phase with the result indicators achieved in project implementation phase.

The three planned result indicators for the project were the collection of a student dataset, the creation and dissemination of Responsible AI Guide for students, and collecting student feedback from the guide itself. In summary, all the main result indicators were successfully achieved. The survey target and feedback target exceeded and the guide was produced and distributed but in slightly different means compared to the originally intended measurement plan.

The reach indicator for the guide was initially indicated through pdf download and link statistic number but instead in project implementation the guide was primarily shared with people in student circles of mine, among others; school group and personal friends, and easier access of project data was given through github and reddit so that the people outside my environment could access and see the guide. This is why, there can be no download number assigned to the guide. Instead, it is assigned as produced guide itself, distributed directly and via online methods, and with student feedback that came after dissemination of guide.

1. Survey completion result indicator

The survey completion result indicator was aimed at measuring the number of students which complete the survey; it was aimed to get **30-50 student** responses according to the target result value from Semester 5 preparation phase. It is the result that project surpassed and we got **62 individual students** responses; survey was given to students in 2 languages that are Turkish and English. Turkish respondents' number was **28 students** while English respondents' number was **34 students**. This is why we could get enough data for the student use of AI and international politics. The student survey showed that students are frequently using AI tools for study, as well as use them to gain information on political events around the world. However, there is a verification gap as only **8.1%** of respondents answered that they always verify information provided by AI tools while **79%** only do so sometimes.

Planned target: 30-50 student completion result indicator

Achieved result: 62 student completion result indicator

Evaluation: Target exceeded

Source of verification: survey results obtained on google forms, screenshots of student responses to the survey, Main Findings from the Survey.

2. Responsible AI Guide distribution result indicator

The result indicator of **responsible AI guide** distribution was about providing a readable and usable tool for students to help them in using the tools responsibly, critically and safer way in regard to AI technology.

The final output was an achievement of Responsible AI Guide for students which has summarized student's survey results and a rule for AI as information instead of absolute information source, 'red flags' of **AI, TRACE** checklist for verification of the material and instructions for how to verify news and reminders about academic integrity in the guide, as student responses show that there is no regular verification and is need of a guide. The reach indicator which was set as **30-50 students** using the guide according to Semester 5, have been measured through direct distribution in students circles such as school groups and friends, as well as publicly making the project visible on GitHub and Reddit, in order to maximize reach of student.

This is why, there cannot be an indication for download number, as there were no single download link to be tracked by download numbers. Therefore it is not considered a failed part in the project and indicator should not be measured based on the initial format it was set for but based on availability, usage and reach of guide through students.

Planned target: 30-50 students' target regarding responsible AI guide distribution

Achieved result: guide created and disseminated through direct access in students circles and through public exposure via Github and Reddit

Evaluation: guide created and disseminated; no PDF download number is specified as per direct distribution and various online platforms.

Source of verification: Responsible AI guide, GitHub repository with all links regarding the project, reddit posts, students, student feedback form.

3. Indicator: Student feedback

The third project indicator was how many student responses to the guide we got once the guide had been circulated. Our objective in the semester 5 project plan for how many student reviews or feedback responses we aimed for was **5-10**. In reality the indicator well surpassed our objective; **14 students responded** to the feedback form. Students felt the guide was well written and helpful in general and could be applied in practice. All respondents to the student feedback form felt the guide was, at least to some degree, comprehensible with **64.3%** of respondents responding 'Yes' and **35.7%** of respondents responding 'Mostly yes'. No respondents answered 'No'.

The guide also seemed to be effective in terms of the awareness objective we set out; **92.9%** of students responding to the question "Did the guide increase your understanding of the critical use of

AI in academic work?" responded 'Yes' while **7.1%** of students responded 'A little'. This result was very positive and shows not only the readability of the guide but that it was also educational to students.

The third positive feedback point we'd like to mention is regarding student verification behavior. **78.6%** of students claimed that they are "More likely" to verify information generated by AI; this feedback is really encouraging when it comes to the problem we are tackling in our survey, as many students do not seem to be verifying what an AI produces regularly.

Students chose "The overall summary" (**42.9%**), "Red flags / warning signs" (**28.6%**), "Survey findings" (**14.3%**), and "Verification tips" (**14.3%**) as the most useful part of the guide; this proves students found the overall summary to be clear as well as being interested in the practical warning signals of unreliable information generated by an AI.

Limited open feedback indicates the guide was well written, practical, and helped in responsible use of AI. The **TRACE** checklist and red flags portions were seen as useful and a few useful but relatively minor critiques were raised concerning the layout, the visual accessibility and the practicality of using it as a ready reference. The guide's reception was overwhelmingly positive and we deemed no major changes to be necessary, though suggestions were made for future revisions.

Planned Target: 5-10 student reviews or feedback responses

Achieved Result: 14 student reviews or feedback responses

Evaluation: Surpassed target

Source of verification: Student feedback form, Feedback on the Responsible AI Guide for Students, Positive Impact Summary.

4. Evaluation of all Indicators

Overall, the results of the indicators confirm the success of our project. We significantly surpassed the target for survey responses with **62 total** responses as compared to our goal of **30-50**; we also surpassed our target for student feedback responses by collecting 14 versus the goal of **5-10**.

Although we created and shared the Responsible AI Guide as per our project plan, we did so more directly and practically, compared to the original metric of the percentage of downloads of a PDF, thus measuring this indicator in a different way.

The indicator that was most drastically altered from our initial project plan was our measure of guide reach. It is now measured in a more comprehensive, and thus more practical, manner compared to simply number of downloads of a PDF; the guide has now been shared directly with students, peers, within the school network and made easily accessible to students through platforms like **GitHub** and **Reddit**, so exact download statistics are unavailable. The existence of the finalized

guide on online sharing sites and the student feedback results confirm that the guide has been successfully disseminated and utilized.

One positive factor that can be seen in this evaluation is the confirmation of student feedback in relation to our survey results. The survey showed us that the usage rate of AI among students is extremely high but that verification does not happen enough, this is precisely the problem our guide tries to solve and as our feedback indicates students found it useful and felt that their level of knowledge on critical **AI** use increased and that they are now more likely to verify what an AI says. Therefore, using all our main project indicators, this project has been successful; our main research objective for our survey was met, and our main practical objective to produce and distribute the **Responsible AI Guide** was completed. We met the awareness objective using our feedback indicators.

5. Source of Verification

Below are the materials that have been used to evaluate the indicators in this appendix:

- Semester 5 Project Preparation Report
- Survey response statistics gathered via Google Forms and screenshots of individual survey responses
- Summary statistics from student survey
- Responsible AI Guide for Students
- Project files shared via GitHub repository and their corresponding links
- Project/guide shared via Reddit post
- Direct distribution to students and peer group
- Student feedback form
- Feedback on the Responsible AI Guide for Students
- Positive Impact Summary of the Responsible AI Guide
- Student feedback form results
