PROJECT TITLE
AI TOOLS AND STUDENTS' UNDERSTANDING OF INTERNATIONAL ISSUES

PROJEKTY SPOŁECZNE

STUDENTÓW
UNIwersytetu VIZJA

**I. PROJECT IMPLEMENTATION PHASE ASSUMPTION**

1. The project should be carried out in accordance with the assumptions developed as part of the course "Project Preparation Methodology" in semester 5.
2. The student project LOGO must be included in the implementation report.

II. PROJECT IMPLEMENTATION REPORT (5-6 pages with description)**OBLIGATORY PART**

Chapter 1. Project objective:	Attachments¹
– <i>have the stated objectives of the project been achieved?</i> – <i>to what extent have the stated objectives of the project been realized in practice?</i>	
My main goal for this project was to research how students at a university level use AI to inform themselves about international political issues and to raise awareness for a responsible, critical and safe use of AI in the academic context. Students' usage behavior, their confidence level in AI-generated content, their verification habits and the possible risks in the study of international political issues were of primary focus. In terms of practice, the goals were for the most part reached. First of all, I conducted a student survey (with Turkish and English versions) in order to reach a wider group of respondents. A total of 62 responses were gathered (28 in Turkish, 34 in English), and it was clear that AI tools are widely used by students in academic work. In total, 72.6% of respondents reported using AI daily or several times per week. This confirmed the relevance and importance of the topic to my target group. Another important issue I discovered, which also corresponds with my project's goal, was the verification gap. Although 71% of respondents reported that they had encountered false or misleading AI-generated information, only a small number of students systematically checked AI-generated information with other sources. Only 8.1% stated that they always verify AI-generated information. This means there is a gap between the fact that AI tools are very present in students' academic lives and the fact that many students do not verify AI outputs consistently.	1A 1B 4A 4B 4C 4D 4E

¹The numbering of attachments and their designation should be in accordance with the template indicated in Part III. DOCUMENTATION CONFIRMING THE IMPLEMENTATION OF THE PROJECT (ATTACHMENTS)

Finding	Result
Frequent AI use in academic work	72.6% 
Encountered false or misleading AI information	71.0% 
Always verify AI-generated information	8.1% 

Figure 1. Main survey findings based on 62 student responses. The results show frequent AI use and a clear verification gap among students.

Following this, I created an instructional material (Responsible AI Guide for Students) which is intended to help students realize that they should use AI tools as a starting point and not a final authority, offering information about survey results, red flags, academic integrity warnings, as well as the TRACE checklist for verifying sources.

My goals were also achieved when it came to collecting feedback on the produced material. A brief feedback form, filled in by 14 respondents, showed that the guide was perceived as easy to understand: 64.3% answered “Yes” and 35.7% answered “Mostly yes.”

Answer	Result
Yes	64.3% 
Mostly Yes	35.7% 
No	0% 

Figure 2. Feedback on guide clarity based on 14 student responses. The results show that all respondents found the Responsible AI Guide easy or mostly easy to understand.

The feedback also showed that the guide was useful and practical. It appears to have raised awareness for critical thinking when using AI, since 92.9% of respondents answered that the material helped them better understand how to use AI more critically in academic work.

In conclusion, the set goals of this project were successfully achieved. It provided insights into the behavior of students, created a useful and practical educational tool for students, raised their awareness on critical thinking as well as plagiarism and supported them in understanding how to use AI tools in a more responsible and safer manner in academia.

Chapter 2. Description of completed activities with reference to the schedule:

- *have the planned activities been carried out?*
- *have the activities been carried out according to the schedule?*
- *what were the deviations during the implementation of the activities and the schedule?*

Attachments¹

All activities were performed as planned based on the general assumptions developed during the semester 5 course Project Preparation Methodology. The project implementation followed a logical path from initial research to producing a practical product, which was evaluated by the target audience. It was implemented as following: preparation of the research framework, designing and distributing the survey, analyzing the data obtained from the survey, creation of the Responsible AI Guide for Students, distribution of the guide and getting student feedback.

The first task to be accomplished was to design the framework of the project. In this stage, I decided on the main problem of the project and its focus. Four aspects were to be investigated in my project: frequency of student use of AI tools, the impact of AI use on students' understanding of international affairs, students' trust to AI-generated information and risks of the use of AI tools in terms of the study of the world affairs and academic work. In that manner I combined the topic of AI with the study of international relations.

The second phase that has been finished was to design and distribute the survey. The survey was designed using Google Forms and distributed online. Since the project should reach both the Turkish-speaking students and international students, there were two separate versions of the questionnaire: one in Turkish and the other one in English. It included questions about demographics, multiple choice questions regarding usage of AI tools and the trust in AI, as well as an open-ended question on the risks associated with the use of AI tools in the academic work. A total of 62 responses were collected from students.

The third phase was analysis of the received results and preparation of a summary of the findings. A total of 62 answers were collected during the survey and analyzed by me to demonstrate how widely AI tools are used in students' studies and how

2A
2B
4A
4B
4C

often they are used for studying world politics. The analysis also demonstrated clear concern on how the information provided by AI may be unreliable or inaccurate.

The fourth step was creation of the Responsible AI Guide for Students. The contents of the guide were determined by the most frequent and the most relevant concerns shown by the survey participants. The guide provided practical suggestions on how to evaluate AI-produced information. A simplified format was chosen to make the guide more accessible to students while studying or doing assignments.

The fifth activity consisted in the distribution of the guide and its evaluation. After distributing the guide online, I conducted a survey of students on their perception of the guide, its utility, clarity, and the extent to which it may make them more cautious in using AI tools. A small questionnaire on the guide has been prepared and a total of 14 answers have been received from students.

In general, activities were performed as planned. There were no significant delays or modifications of the plan. Small adjustments have occurred as mentioned. Firstly, number of obtained survey answers (62) significantly surpassed the range estimated in the survey framework (30-50 answers). It could be perceived as a positive deviation from the plan. Secondly, the number of student feedback responses on the guide (14) also went over the specified range (5-10 answers). And thirdly, detailed data on guide's usage and reach are not available in the attached documentation and the data is only verifiable through its distribution and feedback.

In summary, all steps were completed mostly according to the planned timeline with minor successful changes in number of responses in each step of the project. This project consisted of successful research, development and evaluation stages.

Chapter 3. Achieved project results with reference to target values of result measurement indicators:

- *have the intended results been achieved?*
- *have the target values of the result measurement indicators been achieved?*
- *what were the deviations in the course of achieving the results of the project and the indicators of their measurement?*

Attachments¹

All intended outcomes of the project have been achieved at a high level. The three intended project outcomes were student survey completion and analysis, development of the Responsible AI Guide for Students, and student feedback collected.

4E

The first intended outcome of the project was to obtain and analyze student perspectives on using AI tools in academic coursework and understanding international relations. The success criteria for this project outcome was 30-50 students submitting a complete survey. This was exceeded when 62 different

students successfully submitted a survey in either Turkish or English language. A total of 28 responses were submitted in Turkish, and 34 in English.

From the survey results, it appears AI is becoming a commonplace part of student work, with 48.4% of student respondents utilizing AI on a daily basis, and an additional 24.2% using AI several times a week, totaling 72.6% of students actively using AI in their academic work. No respondents reported never utilizing AI tools in their academic studies. Furthermore, the survey was able to obtain evidence for key risks, with 71% of student respondents reporting that they had encountered false or misleading AI-generated information. However, only 8.1% stated that they always verify AI-generated information, while 79% verify the information only sometimes. This indicated a clear gap in verification, where students regularly used AI tools, understood they sometimes produced misinformation, and frequently failed to carefully verify AI-generated information.

The second intended outcome was the creation of a student-friendly Responsible AI Guide. This goal was met as the PDF guide, which serves for research in international relations and general academic use, was created. This guide included key survey findings, a core rule to utilize AI as a starting point, not a final resource, flags indicating untrustworthy AI output, the TRACE verification checklist, tips for political verification, and reminders for academic integrity. The guide responded to all issues found in the survey, such as misinformation, fabrication, poor verification, plagiarism and over-dependence on AI.

The third intended outcome was to provide increased student awareness, and gain feedback on the usability of the guide. The success criteria was 5-10 student review responses. This was exceeded by 14 feedback responses. All respondents replied "Yes" or "Mostly Yes," stating that the guide was easy to understand. 92.9% of respondents said the guide helped them better understand how to use AI more critically in academic work. Also, 78.6% reported that after reading the guide, they are more likely to verify AI-generated information. Through the feedback analysis, it became apparent that students most valued the guide's overall summary, selected by 42.9% of respondents, and the red flag warning section, selected by 28.6%. Survey findings and verification tips were each selected by 14.3% of respondents. This indicated the usefulness of the practical approach taken in the guide.

The third intended outcome was to provide increased student awareness... This indicated the usefulness of the practical approach taken in the guide.

Indicator	Result
Helped students use AI more critically	92.9%
More likely to verify AI-generated information	78.6%
Easy or mostly easy to understand	100% of analyzed responses

Figure 3. Feedback results based on 14 student responses, showing the practical impact of the Responsible AI Guide on students' critical and responsible use of AI.

There are some slight inconsistencies in measurement. The survey objective was exceeded (30-50 targets, 62 achieved), and the feedback target was exceeded (5-10 targets, 14 replies achieved). However, the number of students who downloaded or clicked on the guide cannot be determined with the resources provided, thus this number cannot be reported without Google Drive or link analytics. Therefore, it is safer to report that the guide was created and distributed, and that its usefulness was confirmed through the feedback responses. »The overall project outcomes were met successfully, collecting higher student survey numbers and exceeding feedback responses. The need for practical student guidance for more responsible use of AI in academia and for understanding international issues became readily clear.

ADDITIONAL PART

Chapter 4. Problems that occurred during the implementation of the project and how the student solved them – have any problems related to the implementation of the project occurred in the course of its implementation? – if so, how were these problems resolved?	Attachments¹
During the project implementation, several small issues were encountered and resolved. All issues were addressed in such a way that they did not detract from the final results. The first problem related to the broad nature of the topic. Both artificial intelligence and international politics are very wide and, therefore, this issue would be easily generalized. I tried to resolve this problem by focusing the issue on university students and their use of artificial intelligence tools in academia for researching the	1B 2A 2B 4A 4C 4D

topic and understanding international politics events and specifically, the level of trust, the spread of misinformation, the reaction to it and critical thinking. In this way, the topic was easier to interpret and quantify.

The second problem was related to preparing the survey in two languages and managing it. Since I wished to survey both Turkish-speaking university students and international students, I created the questionnaire in both languages, Turkish and English. This approach allowed for broader access to participants but required more attention to ensure that both versions assessed the same issue and with similar phrasing. I dealt with this problem by maintaining the same structure and meaning of all questions in both language versions. In the end, 62 distinct students replied to the survey (28 Turkish and 34 English).

The third problem was verification of the guide's exact scope. One of the indicators listed in the plan for semester 5 was to measure the number of downloads for the PDF file, or rather the number of students reached by the guide. In the annexed documentation, Google Drive download statistics or link analysis were not available. I circumvented this by performing a qualitative verification of the guide through: the "Responsible AI Guide for students" final form, the "proof of dissemination" if available, and the 14 feedback responses from students. This proved not only the creation of the guide and its distribution but also that it was actually read and analyzed by students.

The fourth problem was a lack of extensive open-ended feedback. Although 14 people filled out the form, only a few gave a detailed written comment. I resolved this problem by obtaining a quantitative and qualitative feedback. Quantitative feedback, in fact, showed that the guide is easy, useful, and practical, while qualitative feedback served to demonstrate which aspects students were satisfied with or on what they suggested slight improvements, such as layout and the usefulness of the quick-reference format.

The fifth problem was related to design and layout. While some feedback reported that the guide could be more user friendly or accessible graphically, the survey results were overwhelmingly positive, with most participants indicating ease of understanding and usefulness. Thus, there was no need for significant redesigning at this stage. I opted to leave the guide in its current version and recorded the suggested improvements for a potential future version.

In conclusion, although a few minor problems were encountered, they were all addressed through focused work, with careful preparation and monitoring in the survey language translation, and the use of alternative measurement techniques and analysis of results. Consequently, these problems did not hinder the project and its purpose but rather allowed a more in-depth analysis and evaluation of the implementation report.

**III. DOCUMENTATION CONFIRMING THE IMPLEMENTATION OF THE PROJECT**

Attachments in the Report should be labeled according to the following template	
<i>1. Photos, short videos documenting the progress of the project ²</i>	<i>Attachment no. 1A – Screenshot of the Google Forms survey response summary</i> <i>Attachment no. 1B – GitHub Repository Containing Project Files and Project Links</i>
<i>2. Attendance lists</i>	<i>Attachment no. 2A – Google Forms survey participation proof – 62 student responses</i> <i>Attachment no. 2B – Student feedback form participation proof – 14 responses</i>
<i>3. Project documents – beneficiaries' consent for project implementation, letters of congratulation, awards, acknowledgment, etc.</i>	<i>Attachment no. 3A – Semester 5 project preparation report</i> <i>Attachment no. 3B – Project framework presentation: "AI Tools and Students' Understanding of International Issues"</i>
<i>4.
