

Feedback on the Responsible AI Guide for Students

The Responsible AI Guide for Students was also tested using a short five-question feedback form, which was completed after the guide was shared with readers. The feedback form was completed by 14 respondents. The goal of this feedback phase was to evaluate the guide in terms of its clarity, usefulness and practicality to students, as well as whether the guide encourages more critical use of AI in academic work. The findings illustrate that the guide was received well. For the question 'Was the guide easy to understand?', 64.3% of respondents (9 respondents) responded 'Yes', and 35.7% (5 respondents) responded 'Mostly yes'. No respondents indicated that the guide was difficult to understand ('No'). This demonstrates that the guide is relatively clear for the target audience. In the question about whether the guide helped respondents understand the concept of using AI more critically for academic work, 92.9% (13 respondents) said 'Yes' and 7.1% (1 respondent) said 'A little'. Once again, no respondents selected 'No', showing the high effectiveness of the guide. When respondents were asked which section they found most helpful, the 'Overall summary' received the highest rating (42.9% - 6 respondents), followed by 'Red flags/warning signs' (28.6% - 4 respondents). The remaining sections 'Survey findings' and 'Verification tips' both received 14.3% of votes (2 respondents each). These figures suggest that readers valued a concise presentation of the material while also appreciated the identification of questionable or false AI content. When asked if respondents are more likely to verify AI generated information, 78.6% (11 respondents) said 'Yes', 14.3% (2 respondents) said 'Maybe', and 7.1% (1 respondent) said 'No'. This indicates that the guide may have an impact on students' intention to verify AI generated content. The open-ended responses are useful for an in depth look at user feedback. Only 4 respondents left comments but these were still insightful. In terms of general impressions, the feedback suggests three main areas of consensus. Firstly, respondents noted the guide as 'strong', 'practical', 'clear', and 'useful'. One comment specified the guide as a 'very solid guide, great to read for responsible AI use, verification, and academic integrity.' Secondly, the checklist and the red flags section were highlighted as practical, 'encouraging' users to 'think more critically and not just blindly believe AI generated material.' Thirdly, few users pointed to design and structure improvements that would make the guide even more user friendly. One user suggested a quick-reference checklist for both the TRACE steps and the red flags and asked for clarification on some statistics so that students might apply the guide while they are 'actively reading AI text.' Another user felt the layout could have been better. Lastly, one user described the guide as 'very detailed', which could suggest an

encouragingly comprehensive tool or it could be an indication that readers might appreciate a slightly shorter format. Overall, these findings seem to indicate that the Responsible AI Guide for Students achieved its primary objective. Readers viewed it as largely clear, applicable, and relevant, and it seems to have contributed to increased critical thinking about the use of AI in academia among students. Nevertheless, some areas for minor enhancement (related to the interface and visual clarity) were identified and highlighted by feedback. In the long term, further revisions can and will be made. This indicates the existing guide was useful as it was, and can be improved upon using readers' feedback.

Although some minor changes relating to interface and quick-reference use were suggested, the readers reported positive results for the main part of the feedback questions. Consequently, no radical changes were made to the existing guide, though ideas for possible future additions were noted based on the readers' suggestions.

These findings should be considered to be a small, preliminary report as only 14 respondents participated. Nonetheless, for the scope of this project, these results are valuable in that readers positively regarded the guide and it can be considered a successful application in the pedagogical practice of responsible AI use by students.
